

Product Performance Marketing

Unified Meta + Shopify + Google Ads analysis | growifyppm.streamlit.app

WHAT IS THIS TOOL?

Growify PPM is a data analysis tool that **merges your Meta Ads, Shopify, and Google Ads exports into one unified product-level dashboard**. Instead of switching between three platforms and manually combining data in spreadsheets, you upload three raw CSV files and the tool does the rest — cleaning, merging, calculating ROI, and segmenting products into performance quadrants with AI-powered recommendations.

Access the tool at: growifyppm.streamlit.app

HOW IT WORKS — AT A GLANCE

- 1 Download raw exports from Meta Ads, Shopify, and Google Ads (Google optional)
- 2 Upload files — the tool auto-cleans everything. No manual formatting required
- 3 Click Merge & Analyse. The tool joins all data on Product ID
- 4 Use Overall View to filter, analyse, and download product performance data
- 5 Switch to Quadrant View for AI-powered product segmentation and budget insights

The tool auto-cleans all files — splits the Meta Product ID + Title, renames Shopify's variant ID, skips Google's metadata header rows, converts month formats, and extracts numeric IDs. Upload your raw exports exactly as downloaded.

Step 1 — Download Your Data

Download CSV export from each platform using the exact settings below. Do not modify the file after downloading — the tool handles all cleaning automatically.

META ADS

- 1 Open Ads Manager
- 2 Click Reports → Create new report
- 3 Set your date range (e.g. March 1 – May 14)
- 4 Set breakdown to Product ID + Month only (no other dimensions)
- 5 Tick these metrics (see pills below):
- 6 Click Export → Download as CSV

Amount Spent (INR)	Landing Page Views	CTR (all)	CPM (cost per 1,000 impressions)
--------------------	--------------------	-----------	----------------------------------

The Product ID column in Meta exports contains both the ID and product title in one cell (e.g. '12345678, Blue Kurta Set'). The tool splits these automatically.

SHOPIFY

- 1 Go to Analytics → Reports
- 2 Search for: Total sales by Product Variant
- 3 Set your date range to match your Meta date range
- 4 Add to Dimensions:
- 5 — Product Variant ID (not Product ID — this is the mapping key)
- 6 — Month
- 7 Export as CSV

Product Variant ID	Month	Net Items Sold	Net Sales
--------------------	-------	----------------	-----------

Use Product Variant ID, not Product ID. This is the field the tool uses to match Shopify revenue to Meta spend. The tool renames it to Product ID automatically.

GOOGLE ADS (optional)

- 1 Go to Insights & Reports → Report Editor
- 2 Click Create report (choose a table/data report, not a dashboard)
- 3 Add to Rows: Item ID, Product Title, Month
- 4 Add to Columns: Cost, Conversions
- 5 Set your date range to match Meta and Shopify
- 6 Export as CSV

Item ID	Product Title	Month	Cost	Conversions
---------	---------------	-------	------	-------------

Step 2 — Product Analysis- Overall View

— UPLOAD & MERGE

- 1 Upload your Meta CSV in the Meta Ads upload box
- 2 Upload your Shopify CSV in the Shopify upload box
- 3 Upload your Google Ads CSV (optional) — analysis runs without it
- 4 After uploading, you'll see a green 'Cleaned' confirmation with a row count
- 5 Click Merge & Analyse — the tool joins all data on Product ID

— PERIOD SELECTOR + DYNAMIC KPIS

After merging, a **Period dropdown** appears at the top. Select **All Months** (default) to see combined totals across all months in your file, or pick a specific month to filter everything to that period.

Total Products	Meta Spend	Google Cost
Unique products in the selected period	Total Meta ad spend (INR)	Total Google ad cost (INR)
Total Spend	Shopify Revenue	Overall ROI
Meta + Google combined	Net sales from Shopify	Revenue divided by Total Spend

— COLUMNS & FILTERS

Below the KPIs is the **Columns & Filters** section. Use the multi-select to choose which metrics appear in the table. By default all columns are shown.

Open the **Metric Filters** dropdown. For each selected column you can set a condition:

- 1 Choose a condition from the dropdown:
- 2 — > Greater than / < Less than / = Equals / — None (disabled)
- 3 Enter a value (e.g. Total Spend > 1000)
- 4 Use the Product search box for title or ID search
- 5 Use Variant search to filter by size/colour variants
- 6 Click Apply Filters — the panel closes and the table updates
- 7 Click Reset to clear all filters and return to full results

Filters only apply after clicking **Apply Filters**. The row count badge below the filters shows how many products match, and filtered KPI totals appear automatically.

— DOWNLOAD YOUR RESULTS

- 1 After filtering, scroll to the bottom of the table
- 2 Enter a file name in the file name box (e.g. April_high_spend_products)
- 3 Click Download CSV
- 4 The file saves to your default downloads folder with only the selected columns and filtered rows

Step 3 — Quadrant View + AI Analysis

The Quadrant View classifies every product into one of four performance buckets based on how much was spent vs how much revenue was generated. Then Gemini AI analyses the top and bottom performers in each quadrant with month-by-month breakdowns and budget recommendations.

— OPENING QUADRANT VIEW

- 1 From the Overall View page, click the Quadrant View button in the navigation
- 2 The same data you uploaded is used — no need to re-upload
- 3 Adjust Quadrant Thresholds from the left sidebar if needed (default = 100% of portfolio average)
- 4 The four quadrant cards appear with live KPIs

— THE FOUR QUADRANTS

Each product is assigned to one quadrant based on its total spend vs total revenue, relative to the portfolio averages (adjustable via the threshold sliders).

■ High Potential HighRevenue · Low Spend — strong returns with room to scale. These products deserve more budget.	■ High Conversion HighRevenue · High Spend — proven performers. Monitor efficiency and watch for diminishing returns.
■ Zombie LowRevenue · Low Spend — minimal activity. Assess whether to refresh or discontinue.	■ Low Performing LowRevenue · HighSpend — budget drain. Pause or drastically reduce spend immediately.

Quadrant Thresholds: The default is 100% (= portfolio average). Raising the High Spend threshold to 150% means only products spending 1.5x the average are labelled 'high spend'. The sidebar shows Live Cut-off Values so you can see exactly where the lines are drawn.

— AI ANALYSIS — POWERED BY GEMINI

Click **Generate AI Analysis** to send the full product data to Gemini. The AI analyses all four quadrants and returns four expandable insight cards. Each card includes exact product titles, INR figures, month-by-month breakdowns, ROAS calculations, and specific budget recommendations.

■ Insight 1 — High Potential (Top 25%) Monthly spend/revenue/ROI breakdown for the top 25% high-potential products. Identifies which to scale and by how much (in INR).	■ Insight 2 — High Conversion (Top 25%) Spend and revenue trends per month for top converters. Flags scaling candidates and products with declining revenue despite high spend.
■ Insight 3 — Low Performing (Budget Waste) Budget waste = Spend minus Revenue per product. Lists which to pause immediately and which to test at 50% spend, with exact INR recovery amounts.	■ Insight 4 — Portfolio Overview Total spend vs revenue vs ROI across all quadrants. Monthly trend summary and 3 strategic budget reallocation recommendations with INR figures.
